

# Distribution of Commercial Network Resource of the United States

Nicholas Wang, University of Illinois at Urbana-Champaign

## Goals

The main goal of this project is to give one a clear view on “how the network resources are distributed” throughout the contiguous United States. Is it fair? Is there a unique pattern?

## Findings

From the mapped data set, we may conclude that the IP address resource is mostly distributed fairly, based on the population density of different areas, despite few areas like California and New York where naturally have more address used, mainly due to their local industry relies the internet heavily.

## Data Source

MaxMind, Inc.  
United States Census Bureau
